1 Introduction

2 Methodology

3 Results

3.1 Model Performance

Table 1: ROC AUC comparison for cross-validated Decision Tree and Random Forest models.

Model	CV ROC AUC	Test ROC AUC	Test Rows
Decision Tree — With Risk	0.7072	0.7664	295
Random Forest — Without Risk	0.7101	0.7603	295
Random Forest — With Risk	0.7095	0.7599	295
Decision Tree — Without Risk	0.6994	0.7557	295

3.2 Feature Importance

Rank	Research theme	Mean importance
1	Secondary mathematics preparation	0.2755
2	Composite risk measure	0.2381
3	Preparatory mathematics	0.2320
4	Previous university performance	0.1090
5	Secondary school achievement	0.1058
6	Student characteristics	0.0395

3.3 Feature Rankings

Rank	Feature	Models	Mean importance
1	Composite risk index	2	0.4762
2	Prior preparatory mathematics	4	0.1694
3	Secondary mathematics: Other	4	0.1019
4	Secondary mathematics: Standard	4	0.0950
5	Previous attempt at current subject	4	0.0693
6	Previous preparatory mathematics pass	4	0.0532
7	Previous failure in current subject	4	0.0397
8	International student	4	0.0395
9	Secondary school mark below 70	4	0.0394
10	Secondary mathematics: Extension 1	4	0.0348
11	Secondary school mark 90 or above	4	0.0288
12	Secondary mathematics: Extension 2	4	0.0257
13	Secondary school mark 80–89	4	0.0228
14	Secondary mathematics: Advanced	4	0.0182
15	Secondary school mark 70–79	4	0.0148
16	Previous preparatory mathematics failure	4	0.0094

3.4 Model Interpretation

Across the tuned tree-based models, secondary mathematics preparation showed the greatest average predictive importance. This was followed by the composite risk measure and preparatory mathematics. In contrast, student characteristics made the smallest average contribution across models.

4 Discussion

5 Conclusion
